```
# 🧪 Lab: Investigating the ARP Table and Protocol
## 🧪 Step 3: Capture ARP Traffic with Wireshark
    ```CMD
    netsh interface ip delete arpcache
    ```
4. Ping target device again
    ```CMD
    ping <target IP>
    ```
5. Observe ARP request and reply packets in Wireshark

🧠 Reflection Questions
1. What does the ARP table tell you about your local network? Shows your device's IP to MAC address mappings for devices on your local network.
2. Why might an ARP entry be missing? The target device is down or not on the same subnet.
3. What happens when you clear the ARP cache? All the IP to MAC address mappings are removed, forcing the device to re learn these mappings through ARP requests.
4. How does Wireshark help visualize Layer 2 communication? By capturing and displaying Ethernet frames, showing MAC addresses, frame types, and data.

```
